

ChatGPT-Style AI for Sales Enablement

A business case for faster selling, sharper decisions, and measurable pipeline impact

Why AI · How it works · Where we use it · What it is worth

Prepared by Amr Ashraf

Supervisor: Dr. Ahmed Bahgat Elseddawy

1. The business problem

Sellers do not lack data. They lack fast access to the right commercial facts.

CRM

Accounts, opportunities, stage, contacts

ERP

Orders, invoices, inventory, pricing

Knowledge

Specs, playbooks, proposal templates

SEARCH WASTE

7.5 hrs/week

Planning baseline per rep

SELLING TIME TODAY

52%

Too little time with customers

RESPONSE DELAY

9.5 hours

Average first response

Business consequence: slower cycles, weaker follow-up, and stalled deals that wait for attention instead of action.

2. The power of AI: Why · How · Where

The power of AI in this sales case

Executive takeaway

- Why: return time to selling and reduce deal delay
- How: Ask → Retrieve → Act over CRM/ERP facts
- Where: briefings, outreach, risk alerts, forecast
- Rule: AI recommends; humans decide
- Framework note: grounded retrieval + review — not a new system of record

3. Where we used AI in this case

Meeting prep

“Summarize ABC Company.”

One briefing from open opportunities and latest activity.

Commercial outreach

Draft email to IT Director

400-seat Enterprise License Pack proposal — \$48,000.

Deal risk

“Why is this deal at risk?”

Network refresh — \$76,500 — quiet for 18 days.

Management forecast

Baseline vs With AI

Monte Carlo on the open commercial pipeline.

4. How the assistant works for the business

Not a new CRM. Not a new ERP. A conversational layer on trusted commercial data.

1

Ask

Seller asks in plain language without tool-switching.

2

Retrieve

AI pulls the relevant account, deal, and content facts.

3

Act

AI drafts the briefing, email, or risk note for human review.

Light AI framework: answers are grounded in retrieved enterprise context; a person remains accountable before anything is sent to a customer.

5. Operating targets: how the sales week should improve

Academic planning targets from industry-style benchmarks. These measure productivity — not dollars.

Target moves

- Selling time: 52% → 68%
- Relative gain: +31%
 $((68-52)/52)$
- Completeness: +35%
(~60% → ~81%)
- Response: 9.5h → 2.0h
(-79%)
- Search: 7.5 hrs/week baseline

6. Keep the metrics honest

+10.8% expected revenue $\neq$ +31% selling time

Different questions. Same strategic direction. Do not mix them in one claim.

Layer A — Operating model

- Selling-time share
- Response speed
- CRM completeness
- Search hours

Layer B — Money impact

- Open pipeline forecast
- Baseline vs With AI
- Mean / P10 / P90 / Q2
- Dashboard for management

7. Evidence base used for the commercial proof

Featured commercial cases match the story: ABC license proposal (\$48k) and ABC network refresh stalled 18 days (\$76.5k). AI is tested on the same open book — not on a second invented dataset.

8. What AI is worth on the open pipeline

Monte Carlo result — same deals, AI-assisted selling assumptions

BASELINE

\$45.90M

Expected 2026 won \$

WITH AI

\$50.88M

+\$4.98M expected

UPLIFT

+10.8%

Mean vs baseline

Q2 AI

\$16.55M

+15.1% vs Q2 base

Monte Carlo mean and P10-P90 range
pipeline.csv · 1,000 trials · seed 20260317

Risk band (AI)

- P10 \$38.36M
- P50 \$50.58M
- P90 \$64.09M
- Plan on the mean
- Treat P90 as upside
- Not a committed quota

9. Management dashboard

Live view: pipeline facts, forecast controls, distribution, and executive infographic

Pipeline Monte Carlo

Dataset pipeline.csv. Each trial wins or loses every open deal, shocks the amount, and slips the close date. Revenue counts when the close lands on or before 2026-12-31.

Open deals	Quoted pipeline	Stalled proposal or negotiation
3,600	\$131,056,800	499

Those three figures are read from the file. They stay fixed. The revenue table below is the simulation, and it updates when you click Run forecast.

Trials per scenario

1000

Random seed

20260317

Run forecast

Start with 1,000 trials. On this file, 3,000–4,000 trials can take a few minutes — keep the tab open and wait for Running... to finish; do not refresh. Seed 20260317 and 4,000 trials reproduce the saved forecast only for pipeline.csv. The AI scenario

Management infographic

Live view of this run, styled like the simulation results brief.

BASELINE MEAN

\$45,904,718

Central expected outcome

AI MEAN

\$50,881,473

With assistant assumptions

Q2 BASELINE

\$14,377,272

1 Apr–30 Jun 2026

Q2 WITH AI

\$16,551,475

+15.1% vs baseline Q2

EXPECTED REVENUE UPLIFT

```
Run: python montecarlo.py --dataset pipeline.csv --serve --port 8768
```

10. What to do next

1. Win time back

Cut search drag and raise selling-time share toward 68%.

2. Protect momentum

Auto-surface stalls like the 18-day ABC negotiation.

3. Improve quality

Lift CRM completeness (~60% → ~81%) so forecasts and briefs are cleaner.

4. Decide with ranges

Use mean for planning and P10/P90 for risk conversations.

11. Bottom line

Commercial proof

\$50.88M

Expected 2026 won revenue with AI

- +10.8% vs \$45.90M baseline
- +\$4.98M expected value
- Q2 AI \$16.55M (+15.1%)
- Same open book — better assumptions

Business recommendation

1. Deploy AI where sellers lose time: briefing, drafting, stall alerts.
2. Keep humans accountable for customer send and deal decisions.
3. Track operating KPIs and revenue impact separately.
4. Rerun the dashboard monthly as the open book changes.
5. Use +10.8% as planning uplift; treat P90 as upside only.

AI is valuable here because it turns fragmented commercial data into faster action — and the simulation shows that action is worth real pipeline money.
